Dead Tank Circuit Breakers

Advanced Switchgear Technology
for Reliable Performance

imagination at work

Today's Environment

The world needs more energy. The International Energy Agency (IEA) estimates¹ that in order to keep up with demand, \$20 trillion will need to be invested in power and grid technologies over the next 25 years. Much of that growth is expected to come in the form of renewable energy which, according to a IEA report² from 2015, will represent the largest single source of electricity growth over the next five years (rising to a 26 % share of global generation).

Utilities are struggling with the increasing challenge of integrating renewable energy sources into the grid. Integration can conflict with existing modernization and optimization plans. Issues of reliability, safety, power quality and economics have to be taken into account when planning substations and choosing switchgear.

Additionally power systems are already interconnected, highly complex networks that are susceptible to instabilities. Utilities face several challenges in managing and maintaining today's complex grid, including:

- Increasing grid efficiency and resilience without the necessary funding to invest in new capital equipment.
- Expertise to manage the grid is rapidly diminishing due to the exit of skilled, technical resources from the workplace.

Overall, utilities are under intense scrutiny, by both regulatory agencies and the public, to prevent catastrophic power system failures today and in the future.

Dead Tank Circuit Breakers Overview

GE offers utilities advanced solutions to improve grid stability and increase efficiency of transmission infrastructure. High-voltage circuit breakers, the heart of power systems, protect electrical equipment and infrastructure, fulfilling operational and safety functions. In normal operation, they carry nominal load currents, and depending on the installation, switch various equipment such as lines or transformers.

When a fault occurs, it is the job of the circuit breakers to interrupt short-circuit currents, specifically those that may reach 20 to 25 times the rated nominal current. The magnitude of the interrupted power may be of an order comparable to the power consumption of a major city. Even after prolonged intervals of several years, the breakers must absolutely guarantee reliable switching performance.

With more than 25,000 Dead Tank Circuit Breakers installed and in service around the world, GE is recognised as one of the technological leaders ensuring reliability and safety of operations at an optimized cost.

The GE Advantage

GE's Dead Tank Circuit Breakers are developed based on the highest standards for performance, ratings, user convenience and reliability. Every circuit breaker model is thoroughly tested to meet or exceed the latest IEEE and IEC standards including Class C2, Class M2, fast TRV and high asymmetry.

Unique and Superior Design Provides Optimal Performance and Lower Total Cost of Ownership

- Durable spring-spring mechanism provides 5 times more reliability than hydraulic, pneumatic or hydraulic-spring designs according to CIGRE report 510.
- Innovative interrupter design with self-blast technology reduces required mechanical energy to clear fault currents without any sacrifice in performance or reliability.
- Designed to operate within extreme environmental conditions with available options for high elevation, very low and high temperatures (-60° C to +60° C), seismic zones, polluted areas, and corrosive atmospheres.

Manufacturing Excellence to Ensure Highest Quality Standards

- Global manufacturing sites are certified according to ISO 9001 and ISO 14001.
- Products are manufactured using GE's Advanced Production System ensuring the highest level of quality.
- Available customization expertise to meet customer unique application requirements.

Extensive Research, Testing and Proven Field Experience Resulting in Enhanced Reliability

- R&D Competence Center and associated testing laboratories located at GE's Charleroi, Pennsylvania, United States facility.
- Dead Tank Circuit Breakers are type tested for more than 10,000 mechanical operations exceeding IEEE and IEC Class M2 standards.
- Industry-best SF₆ tightness testing system, guaranteeing lower than 0.5 % annual emission rate through quantified routine tests for every Dead Tank Circuit Breaker manufactured in the Charleroi plant.
- To date there are over 25,000 dead tank circuit breakers installed and in service in more than 60 countries.

Optional Features for Enhanced System Compatibility, Digital Integration and In-House Expertise

- Complete monitoring system available for asset management and digital substation integration.
- Independent pole operation with Point-on-Wave switching available when required for specific applications.
- Full life-cycle support for products, spare parts management and technical training by circuit breaker experts.
- Local Product Sales Specialists provide strong product and technical support.

GE's Dead Tank Circuit Breaker Technologies

Unique and Superior Design

GE offers a complete range of Dead Tank Circuit Breakers for the protection of critical assets. GE's Dead Tank Circuit Breakers, the DT Series, supports system voltages from 38 kV to 550 kV and are designed for performance, high reliability, maximized safety and lower cost of ownership.

The DT Series is designed to operate within extreme environmental conditions including high elevation, very low and high temperatures (-60°C to +60°C), seismic zones, polluted areas and corrosive atmospheres.

The breakers are designed and tested to meet or exceed the requirements of IEEE and IEC standards including Class M2, for mechanical endurance, Class C2, for back-to-back capacitance switching, and transformer limited faults.

Gang operation is standard (up to 245 kV), and Independent Pole Operation (IPO), is available at all voltage levels.

Spring-Spring-Operated Mechanisms

GE has been developing and manufacturing spring-spring-operated mechanisms since 1938. The most recent state-of-the-art evolution for these mechanisms is the FK 3 range. The FK 3 which is used for all GE high voltage switchgear applications including dead tank, live tank, generator circuit breakers, GIS and hybrid solutions. Over 200,000 FK3 mechanisms are in operation worldwide.

The FK 3 low energy spring-spring mechanism provides the highest level of reliability with Class M2 performance for 10,000 no-load close-open operations without the need for routine maintenance. With a spring-spring operated mechanism there are no pneumatics or hydraulics, ensuring safe, reliable and maintenance-free operation for the normal circuit breaker service life of 50 years or more.

Additionally, the FK 3 series offers very stable operating times with minimal risk of mechanical scatter, making the mechanism well suited for controlled switching applications.

FK 3-X mechanism range used in the DT-Series

Interrupting Chamber

GE circuit breakers use a proven innovative interrupter design with self-blast technology that significantly reduces the required mechanical energy to clear short-circuit currents. The interrupter design uses the arc energy to generate gas compression for the efficient quenching of the arc itself.

As a member of the puffer family, the interrupter has two gas volumes within the chamber, one mechanical and one thermal. The purpose of the interrupter ensures that the circuit breaker will interrupt short-circuit fault current from low level faults to the full nameplate rating.

The single-pressure interrupter uses partial duo-flow, self-blast technology to control and cool the SF₆ exhaust, ensuring proper gas density and dielectric strength while at the same time reducing the risk of contamination. This design ensures long reliable life even as the circuit breaker ages with time and use.

The interrupter housings are made as single-piece aluminum castings, designed to ensure gas tightness and with safety margin for dielectric strength. GE's proprietary particle trap configuration is incorporated in many designs to provide an extra measure of dielectric security.

Manufacturing Excellence

GE's investments in Research and Development (R&D) are significant, allowing utilities and grid operators to benefit from the latest technologies and innovations.

The facilities for research and development and manufacturing are based in the United States, Canada, France, Germany, Russia, China and Japan. The same industrial concept is applied in all locations.

Advanced Production System

The Advanced Production System (APS), is the framework for contemporary manufacturing excellence in all Grid Solutions sites. It is based on lean tools for continuous improvement of safety, quality, cost and delivery.

APS brings together a wide range of best practices and standards in seven domains such as Basics, Environmental, Health & Safety (EHS), Supply Chain, Project Delivery, Manufacturing, and Quality & Leadership to create and sustain world class manufacturing excellence.

Low voltage wiring - local customization of low voltage control cabinets and mechanism cabinets based on user specifications.

Assembly of interrupter - 550 kV interrupter in a clean room environment.

Certified Quality

Research and Development (R&D), manufacturing and commercial units are fully certified according to ISO 9001. This means that during the entire production process, all employees, all equipment and all of the company's operations are dedicated to the highest quality standards and permanent improvement.

The Quality Management System assures the highest level of quality at every step of the value chain. Qualified staff on the Dead Tank Circuit Breaker production lines have proven experience in circuit breaker assembly.

For each step of the production process, detailed operational instructions are used at the respective workstation. Complete traceability of material and workmanship is ensured by means of robust processes and quality controls.

Dead tank circuit breaker assembly – installation of interrupters and current transformers to 72.5 kV dead tank circuit breakers.

Clean room assembly hall - dead tank circuit breakers before routine testing.

Rigorous Testing to International Standards

All dead tank circuit breakers are type tested in world class laboratories such as KEMA, CESI and CERDA, in full compliance with international standards such as IEEE, IEC, GOST and DL standards. Specific homologation processes (additional tests, specific reports) are provided as per customer requirements.

Following tests are performed according to the latest standards:

- Seismic performance
- Dielectric performance including BIL, SIL, RIV, AC withstand and partial discharge
- Mechanical endurance
- Power testing including short circuit, short time withstand, capacitance switching and reactor switching
- Temperature rise continuous current test
- Environmental testing

Competence Center for Dead Tank Circuit Breakers in Charleroi, Pennsylvania, USA

Highlights

- Manufacturing of dead tank circuit breakers up to 550 kV, live tank circuit breakers up to 800 kV and disconnect switches up to 362 kV
- Annual production capacity of 2,000+ circuit breakers
- Site is certified to ISO 9001 and ISO 14001
- A2LA accredited testing facility ISO 17025
- Manufacturing of interrupters for all dead tank circuit breakers produced in Charleroi, PA
- Complete wiring and assembling of low voltage control cabinets and mechanism cabinets locally resulting in greater flexibility to respond to user needs
- 22,000+ circuit breakers delivered from Charleroi site since 1994 (AEG T&D)

Competence Center in Charleroi, PA, USA

Extensive Testing Capabilities

The Research and development laboratories located at the Charleroi plant are certified to ISO 17025 standards and offer extensive testing capacity for development and production testing including; two high voltage test labs, a climatic chamber, continuous current testing, six mechanical testing bays and four SF₆ gas tightness testing systems.

Gas Tightness Testing System

GE has perfected an industry best practice testing system which measures SF₆ gas tightness and quantifies the exact emission rate, with an accuracy of 0.2 grams per year, for every dead tank circuit breaker assembled in the Charleroi plant.

Improved Leakage Rate

In use since 2010, every dead tank circuit breaker manufactured in the Charleroi plant is tested with GE's proprietary technology.

All circuit breakers are tested once fully assembled with bushings installed. Whereas other technologies, such as helium mass spectrometer, only tests smaller components, such as castings.

High accuracy measurement of emission rates below 0.5 % per year is demonstrated in a production environment.

Optional Features for Advanced Systems Capabilities

Controlled Switching Device RPH3

The RPH3 solution, which is the full digital interface between the circuit breakers the substation, helps circuit breakers to close or open at the optimal time. Controlled switching is used for switching capacitor banks, reactor banks, transmission lines and power transformers.

Modular Circuit Breaker Monitoring CBWatch3

CBWatch3 monitors critical circuit breaker health indicators , such as gas density, timing, travel and contact wear. This allows users to optimize and schedule maintenance programs accordingly. The collected data can easily be integrated to asset management programs.

Low Temperature Applications

Dead tank circuit breakers provide sealing and breaking performance as well as mechanical operations guaranteed at very low temperatures, down to -60°C , with optional tank heaters or gas mixtures. This ensure a reliable performance even in the harshest environments around the world.

High Seismic Ratings

Dead tank circuit breakers are available with high seismic performance in accordance with IEEE 693-2005. This standard qualifies the circuit breakers for earthquake levels up to 0.5 g. Higher ratings are available on demand.

Composite Insulators

Composite insulators are significantly lighter and less prone by strikes and blows than procelain insulators. For use in seismic areas, the sensitivity to impact loads and the low weight are considerable advantages. Additionally thanks to silicone's hydrophobic (water-repellent) properties, water just rolls off and does not develop a constant moisture film, specifically in highly polluted and coastal regions.

Pre-Insertion Resistors (PIR)

Series closing resistors limit overvoltages associated with switching unloaded transmission lines and shunt capacitor banks. They reduce voltage disturbances and increase the life of associated equipment in the substation.

Value Added Services

Optimizing Asset Reliability, Up-Time and Performance

Dedicated project teams are located in all regions throughout the world. These on the ground teams provide support and expertise to assist customers during different project phases. Local field service teams are also available worldwide, providing immediate support, training and supervision.

Asset Performance Management

As part of optimizing the maintenance and asset replacement strategies, GE employs stress assessment analysis, SF₆ monitoring and online condition monitoring to allow comprehensive centralized asset management.

Renovation & Modernization

GE has the technical expertise to deliver customized engineered solutions to extend the life of ageing equipment. GE Service Teams are experienced in solving obsolescence issues and overhauling substation equipment as required.

Maintenance and Spare Parts

Maximizing the life cycle performance of circuit breakers through the right maintenance strategy, strategic spare parts stock and toll-free 24/7 hotline.

Technical Training

GE provides on site technical training such as modular and competence development training as well as e-learning and educational partnerships. These skills not only enhance team knowledge, but increase productivity.

Digital Tools that simplify the entire product lifecycle.
